

# Whiskers

This exercise has been designed to test the knowledge on Android API and computer engineering skills. The maximum time expected to do the test is 3 hours.

Design an app that is capable of showing the information provided by a REST service:

GET <http://mycat.com/rest/>

This web service does not exist in the real world because it is being developed by the server team, but we have agreed on the specifications (the JSON are the specs). You can infer the types from the example JSON file.

The app shall be developed to target medium and large displays and any resolution possible, and shall take maximum profit of the data provided in the zip file.

We will evaluate the proper use of the different libraries, components, code cleanup and adaptability. The data acquisition must be mocked up.

Please if you have any doubt carry on an explain why you took any decision.

Thanks for your time.

Bonus points:

Espresso, Volley, Unit testing, Lollipop, AppCompat, UI adaptable
